

## CORE TUBE SOCKET TROUBLES

Before you change that tube socket try "Cool-Amp". Today's heater circuits carry a lot of current, especially those in color TV. This high current causes the pins and socket contacts to heat up, open up and corrode.

To save time and work replacing the socket, get some Cool Amp silver powder and a damp cloth and rub the powder into the tube pins and socket.

The silver helps cool the contact points and the trouble is cured, nerves are soothed.

Cool-Amp is the trade name and is produced by, The Cool-Amp Co., 8603 S. W. 17th Avenue, Portland, Oregon 97219.—*John J. Pirch*

## ADMIRAL 4H12—NO SOUND OR PIX

No sound or picture on channels 7 through 13—or, in some cases, the station comes in on the next higher channel—may be due to a leaky C454. This capacitor 0.01-uF is located under the shield of the sound take-off coil (L403).—*Admiral Service News Letter*

## AC LINE CAPACITOR

The RCA "G" series color TV receivers have a .047- $\mu$ F filter capacitor connected across the ac line (wired directly across the ac interlock terminals). This capacitor can be checked or replaced in the home—using the following procedures:

1. Remove the rear cover and chassis retaining bolts. Slide the chassis slightly rearward to inspect the
