

Figure 1a potentials are approximate DC voltages measured with VTVM

Unlabeled figures are approximate AC RMS voltages with 1000 cycle signal into "IMPED" adjusted to give a 10 WPM output at 15.75 cps into a resistive load. Should require approximately 0.82 WPM RMS.

Unless otherwise specified: Capacitors in decads are MFD. Resistors are 1/2 W composition.

Connect 500W resistors to plates for Triode operation.

Insert Resistors for four Damping Factors.

K=1,000  
M=1,000,000
